Roadmap

Last lecture

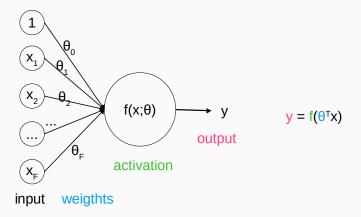

- From perceptrons to neural networks
- multilayer perceptron
- some examples
- · features and limitations

Today

- Learning parameters of neural networks
- The Backpropagation algorithm

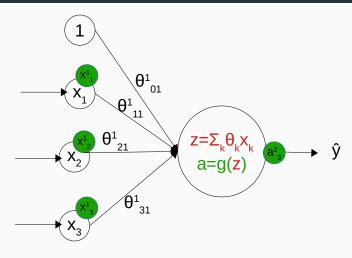

Recap: Multi-layer perceptrons

- Linearly separable data
- Perceptron learning rule

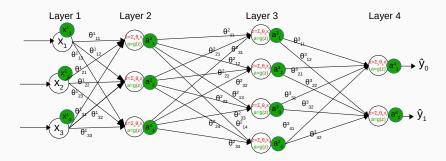

Recap: Multi-layer perceptrons

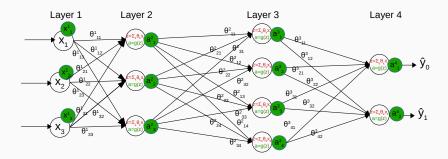

- Linearly separable data
- Perceptron learning rule

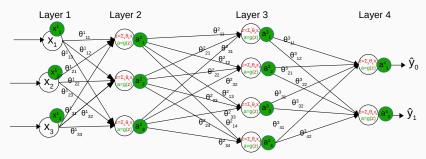

Recap: Multi-layer perceptrons

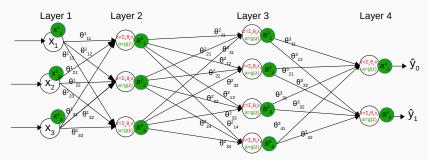

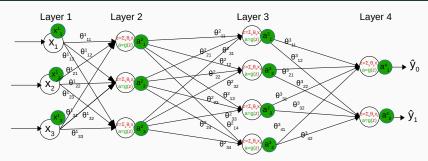

- 1. Forward propagate an input x from the **training set**
- 2. Compute the output \hat{y} with the MLP

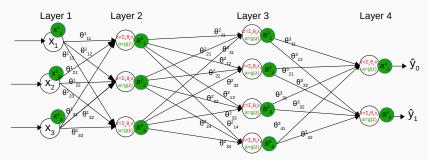

- 1. Forward propagate an input *x* from the **training set**
- 2. Compute the output \hat{y} with the MLP
- 3. Compare predicted output \hat{y} against true output y; compute the **error**

- 1. Forward propagate an input x from the **training set**
- 2. Compute the output \hat{y} with the MLP
- 3. Compare predicted output \hat{y} against true output y; compute the **error**
- Modify each weight such that the error decreases in future predictions (e.g., by applying gradient descent)

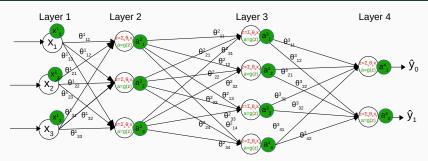

- 1. Forward propagate an input *x* from the **training set**
- 2. Compute the output \hat{y} with the MLP
- 3. Compare predicted output \hat{y} against true output y; compute the **error**
- 4. **Modify each weight** such that the error decreases in future predictions (e.g., by applying **gradient descent**)
- 5. Repeat.

Recall: Optimization with Gradient Descent

We want to

- 1. Find the best parameters, which lead to the smallest error E
- 2. Optimize each model parameter θ_{ik}^{I}
- 3. We will use gradient descent to achieve that

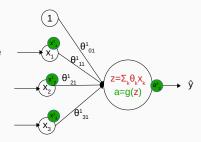

4.
$$\theta_{ij}^{l,(t+1)} \leftarrow \theta_{ij}^{l,(t)} + \Delta \theta_{ij}^{i}$$

Towards Backpropagation

Recall Perceptron learning:

- Pass an input through and compute ŷ
- Compare ŷ against y
- Weight update $\theta_i \leftarrow \theta_i + \eta (y \hat{y}) x_i$

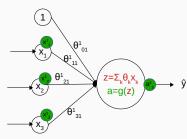

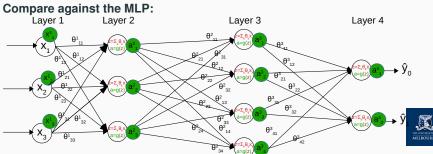

Towards Backpropagation

Recall Perceptron learning:

- Pass an input through and compute ŷ
- Compare ŷ against y
- Weight update $\theta_i \leftarrow \theta_i + \eta(y \hat{y})x_i$

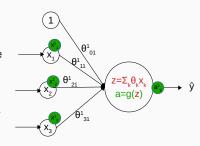

Towards Backpropagation

Recall Perceptron learning:

- Pass an input through and compute ŷ
- Compare ŷ against y
- Weight update $\theta_i \leftarrow \theta_i + \eta(y \hat{y})x_i$

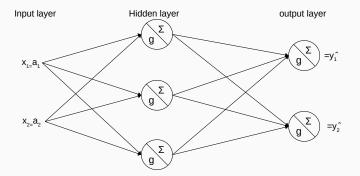

Problems

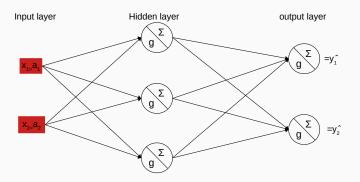

- This update rule depends on true target outputs y
- We only have access to true outputs for the final layer
- We do not know the true activations for the hidden layers. Can we generalize the above rule to also update the hidden layers?

Backpropagation provides us with an efficient way of computing partial derivatives of the error of an MLP wrt. each individual weight.

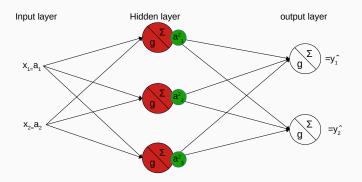

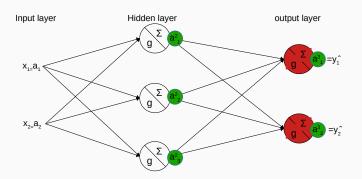

• Receive input

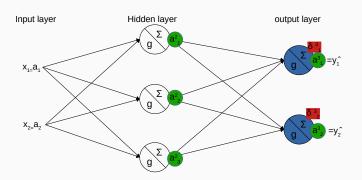

- Receive input
- Forward pass: propagate activations through the network

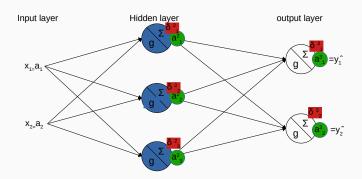

- Receive input
- Forward pass: propagate activations through the network

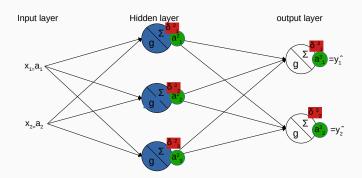

- Receive input
- Forward pass: propagate activations through the network
- Compute Error : compare output \hat{y} against true y

- Receive input
- Forward pass: propagate activations through the network
- Compute Error : compare output \hat{y} against true y
- Backward pass: propagate error terms through the network

- Receive input
- Forward pass: propagate activations through the network
- Compute Error : compare output ŷ against true y
- Backward pass: propagate error terms through the network
- Calculate $\Delta \theta_{ii}^I$ for all θ_{ii}^I
- Update weights $\theta_{ij}^{\prime} \leftarrow \theta_{ij}^{\prime} + \Delta \theta_{ij}^{\prime}$

Interim Summary

- We recall what a MLP is
- We recall that we want to learn its parameters such that our prediction error is minimized
- We recall that gradient descent gives us a rule for updating the weights

$$\theta_i \leftarrow \theta_i + \triangle \theta_i \text{ with } \triangle \theta_i = -\eta \frac{\partial E}{\partial \theta_i}$$

- But how do we compute $\frac{\partial E}{\partial \theta_i}$?
- Backpropagation provides us with an efficient way of computing partial derivatives of the error of an MLP wrt. each individual weight.

The (Generalized) Delta Rule

Backpropagation 1: Model definition

 Assuming a sigmoid activation function, the output of neuron i (or its activation a_i) is

$$a_i = g(z_i) = \frac{1}{1 + e^{-z_i}}$$

• And z_i is the input of all incoming activations into neuron i

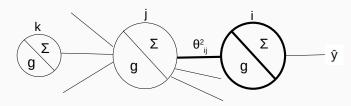

$$z_i = \sum_j \theta_{ij} a_j$$

And Mean Squared Error (MSE) as error function E

$$E = \frac{1}{2N} \sum_{i=1}^{N} (y^{i} - \hat{y}^{i})^{2}$$

Backpropagation 2: Error of the final layer

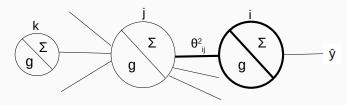

• Apply gradient descend for input p and weight θ_{ij}^2 connecting node j with node i

$$\triangle \theta_{ij}^2 = -\eta \frac{\partial E}{\partial \theta_{ii}^2} = \eta (y^{\rho} - \hat{y^{\rho}}) g'(z_i) a_j$$

Backpropagation 2: Error of the final layer

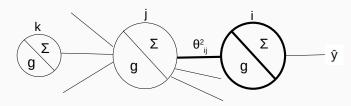

• Apply gradient descend for input p and weight θ_{ij}^2 connecting node j with node i

$$\triangle \theta_{ij}^2 = -\eta \frac{\partial E}{\partial \theta_{ij}^2} = \eta (\mathbf{y}^{p} - \hat{\mathbf{y}^{p}}) \mathbf{g}'(\mathbf{z}_i) \mathbf{a}_j$$

Backpropagation 2: Error of the final layer

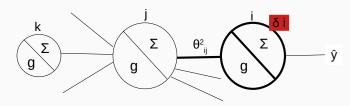

• Apply gradient descend for input p and weight θ_{ij}^2 connecting node j with node i

$$\Delta \theta_{ij}^{2} = -\eta \frac{\partial E}{\partial \theta_{ij}^{2}} = \eta (\mathbf{y}^{\rho} - \hat{\mathbf{y}^{\rho}}) \mathbf{g}'(\mathbf{z}_{i}) \mathbf{a}_{j}$$
$$= \eta \ \delta_{i} \ \mathbf{a}_{j}$$

- The weight update corresponds to an error term (δ_i) scaled by the incoming activation
- We attach a δ to **node** i

Backpropagation: The Generalized Delta Rule

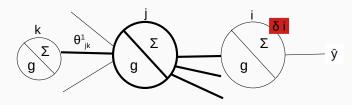

The Generalized Delta Rule

$$\triangle \theta_{ij}^2 = -\eta \frac{\partial E}{\partial \theta_{ij}^2} = \eta (\mathbf{y}^{\rho} - \hat{\mathbf{y}^{\rho}}) \mathbf{g}'(\mathbf{z}_i) \mathbf{a}_j = \eta \, \delta_i \, \mathbf{a}_j$$
$$\delta_i = (\mathbf{y}^{\rho} - \hat{\mathbf{y}^{\rho}}) \mathbf{g}'(\mathbf{z}_i)$$

- The above δ_i can only be applied to output units, because it relies on the target outputs y^p .
- We do not have target outputs y for the intermediate layers

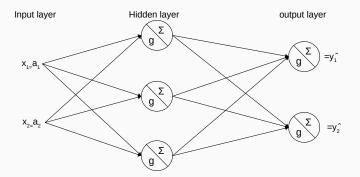

Backpropagation: The Generalized Delta Rule

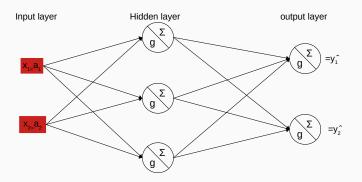

• Instead, we **backpropagate** the errors (δ s) from right to left through the network

$$riangle heta_{jk}^1 = \eta \; \delta_j \; a_k \ \delta_j = \sum_i heta_{ij}^2 \; \delta_i \; g'(z_j)$$

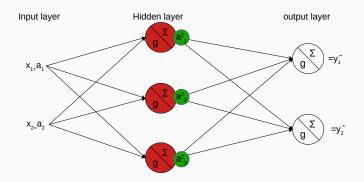

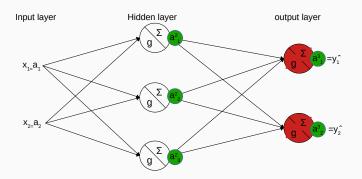

• Receive input

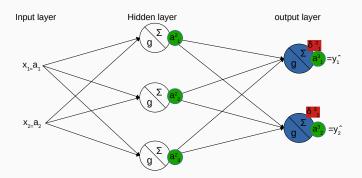

- Receive input
- Forward pass: propagate activations through the network

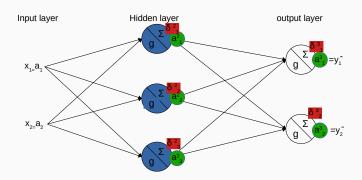

- Receive input
- Forward pass: propagate activations through the network

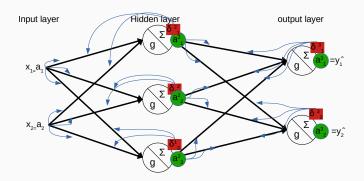

- Receive input
- Forward pass: propagate activations through the network
- \bullet Compute Error : compare output \hat{y} against true y

- · Receive input
- Forward pass: propagate activations through the network
- Compute Error : compare output \hat{y} against true y
- Backward pass: propagate error terms through the network

- Receive input
- Forward pass: propagate activations through the network
- Compute Error : compare output \hat{y} against true y
- Backward pass: propagate error terms through the network
- Calculate $\frac{\partial E}{\partial \theta_{ii}^{I}}$ for all θ_{ij}^{I}
- Update weights $\theta_{ij}^l \leftarrow \theta_{ij}^l + \Delta \theta_{ij}^l$

Backpropagation Algorithm

Design your neural network Initialize parameters θ

repeat

for training instance x_i do

- 1. **Forward pass** the instance through the network, compute activations, determine output
- 2. Compute the error
- 3. Propagate error **back** through the network, and compute for all weights between nodes *ij* in all layers *I*

$$\Delta \theta_{ij}^I = -\eta \frac{\partial E}{\partial \theta_{ij}^I} = \eta \delta_i \mathbf{a}_j$$

4. Update all parameters at once

$$\theta_{ij}^l \leftarrow \theta_{ij}^l + \Delta \theta_{ij}^l$$

until stopping criteria reached.

Summary

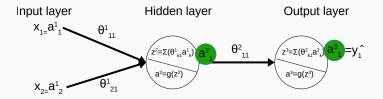

After this lecture, you be able to understand

- Why estimation of the MLP parameters is difficult
- How and why we use Gradient Descent to optimize the parameters
- How Backpropagation is a special instance of gradient descent, which allows us to efficiently compute the gradients of all weights wrt. the error
- The mechanism behind gradient descent
- The mathematical justification of gradient descent

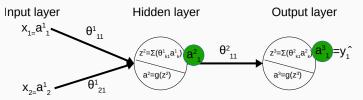

Good job, everyone!

- You now know what (feed forward) neural networks are
- You now know what to consider when designing neural networks
- You now know how to estimate their parameters
- That's more than the average 'data scientist' out there!

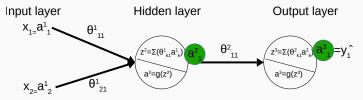

Chain of reactions in the forward pass, focussing on the output layer

- varying a^2 causes a change in z^3
- varying z^3 causes a change in $a_1^3 = g(z^3)$
- varying $a_1^3 = \hat{y}$ causes a change in $E(y, \hat{y})$

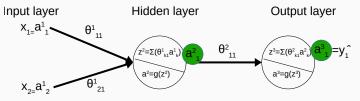

We can use the **chain rule** to capture the behavior of θ_{11}^2 wrt E

$$\Delta\theta^2 = -\eta \frac{\partial E}{\partial \theta^2} = -\eta \Big(\frac{\partial E}{\partial a_1^3}\Big) \Big(\frac{\partial a_1^3}{\partial z^3}\Big) \Big(\frac{\partial z^3}{\partial \theta^2}\Big) \ =$$

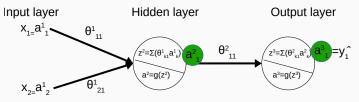

We can use the **chain rule** to capture the behavior of θ_{11}^2 wrt E

$$\Delta\theta^2 = -\eta \frac{\partial E}{\partial \theta^2} = -\eta \Big(\frac{\partial E}{\partial a_1^3}\Big) \Big(\frac{\partial a_1^3}{\partial z^3}\Big) \Big(\frac{\partial z^3}{\partial \theta^2}\Big) \ =$$

$$\frac{\partial E}{\partial a_i} = -(y_i - a_i)$$
 recall that $E = \sum_{i=1}^{N} \frac{1}{2} (y_i - a_i)^2$

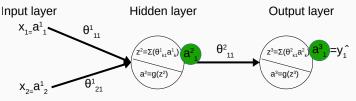

We can use the **chain rule** to capture the behavior of θ_{11}^2 wrt E

$$\Delta\theta^2 = -\eta \frac{\partial E}{\partial \theta^2} = -\eta \Big(\frac{\partial E}{\partial a_1^3}\Big) \Big(\frac{\partial a_1^3}{\partial z^3}\Big) \Big(\frac{\partial z^3}{\partial \theta^2}\Big) \ =$$

$$\frac{\partial E}{\partial a_i} = -(y_i - a_i) \qquad \text{recall that } E = \sum_{i=1}^{N} \frac{1}{2} (y_i - a_i)^2$$

$$\frac{\partial a}{\partial z} = \frac{\partial g(z)}{\partial z} = g'(z)$$

We can use the **chain rule** to capture the behavior of θ_{11}^2 wrt E

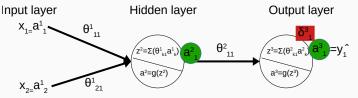

$$\Delta\theta^2 = -\eta \frac{\partial E}{\partial \theta^2} = -\eta \Big(\frac{\partial E}{\partial \textbf{a}_1^3}\Big) \Big(\frac{\partial \textbf{a}_1^3}{\partial \textbf{z}^3}\Big) \Big(\frac{\partial \textbf{z}^3}{\partial \theta^2}\Big) \ =$$

$$\frac{\partial E}{\partial a_i} = -(y_i - a_i) \qquad \text{recall that } E = \sum_{i=1}^{N} \frac{1}{2} (y_i - a_i)^2$$

$$\frac{\partial a}{\partial z} = \frac{\partial g(z)}{\partial z} = g'(z)$$

$$\frac{\partial z}{\partial \theta_{ij}} = \frac{\partial}{\partial \theta_{ij}} \sum_{i'} \theta_{i'j} a_{i'} = \sum_{i'} \frac{\partial}{\partial \theta_{ij}} \theta_{i'j} a_{i'} = a_i$$

We can use the **chain rule** to capture the behavior of θ_{11}^2 wrt E

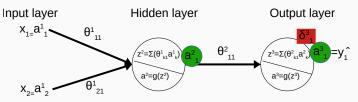

$$\Delta\theta^{2} = -\eta \frac{\partial E}{\partial \theta^{2}} = -\eta \left(\frac{\partial E}{\partial a_{1}^{3}}\right) \left(\frac{\partial a_{1}^{3}}{\partial z^{3}}\right) \left(\frac{\partial z^{3}}{\partial \theta^{2}}\right) = \eta \underbrace{\left(y - a_{1}^{3}\right) \left(g'(z^{3})\right)}_{= \delta_{1}^{3}} \left(a_{1}^{2}\right) = \eta \delta_{1}^{3} a_{1}^{2}$$

$$\frac{\partial E}{\partial a_i} = -(y_i - a_i) \qquad \text{recall that } E = \sum_{i=1}^{N} \frac{1}{2} (y_i - a_i)^2$$

$$\frac{\partial a}{\partial z} = \frac{\partial g(z)}{\partial z} = g'(z)$$

$$\frac{\partial z}{\partial \theta_{ij}} = \frac{\partial}{\partial \theta_{ij}} \sum_{i'} \theta_{i'j} a_{i'} = \sum_{i'} \frac{\partial}{\partial \theta_{ij}} \theta_{i'j} a_{i'} = a_i$$

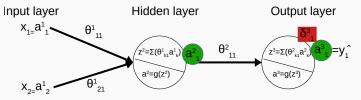

We have another chain reaction. Let's consider layer 2

- varying any θ_{k1}^1 causes a change in z^2
- varying z^2 causes a change in $a_1^2 = g(z^2)$
- varying a_1^2 causes a change in z^3 (we consider θ^2 fixed for the moment)
- varying z^3 causes a change in $a_1^3 = g(z^3)$
- varying $a_1^3 = \hat{y}$ causes a change in $E(y, \hat{y})$

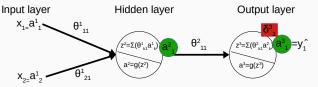

Formulating this again as the chain rule

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial a_{1}^{3}} \right) \left(\frac{\partial a_{1}^{3}}{\partial z^{3}} \right) \left(\frac{\partial z^{3}}{\partial a_{1}^{2}} \right) \right) \left(\frac{\partial a_{1}^{2}}{\partial z^{2}} \right) \left(\frac{\partial z^{2}}{\partial \theta_{k1}^{1}} \right)$$

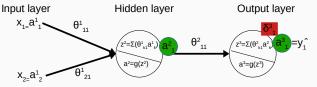

Formulating this again as the chain rule

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial \mathbf{a}_{1}^{3}} \right) \left(\frac{\partial \mathbf{a}_{1}^{3}}{\partial z^{3}} \right) \left(\frac{\partial z^{3}}{\partial \mathbf{a}_{1}^{2}} \right) \right) \left(\frac{\partial \mathbf{a}_{1}^{2}}{\partial z^{2}} \right) \left(\frac{\partial z^{2}}{\partial \theta_{k1}^{1}} \right)$$

We already know that

$$\frac{\partial E}{\partial a_1^3} = -(y - a_1^3)$$
$$\frac{\partial a_1^3}{\partial z^3} = g'(z^3)$$

Formulating this again as the chain rule

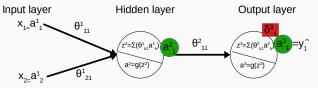

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial a_{1}^{3}} \right) \left(\frac{\partial a_{1}^{3}}{\partial z^{3}} \right) \left(\frac{\partial z^{3}}{\partial a_{1}^{2}} \right) \right) \left(\frac{\partial a_{1}^{2}}{\partial z^{2}} \right) \left(\frac{\partial z^{2}}{\partial \theta_{k1}^{1}} \right)$$

And following the previous logic, we can calculate that

$$\frac{\partial z^3}{\partial a_1^2} = \frac{\partial \theta^2 a_1^2}{\partial a_1^2} = \theta^2$$

$$\frac{\partial a_1^2}{\partial z^2} = \frac{\partial g(z^2)}{\partial z^2} = g'(z^2) \qquad \qquad \frac{\partial z^2}{\partial \theta_{k1}^1} = a_k$$

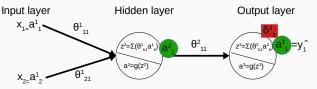

Formulating this again as the chain rule

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial \mathbf{a}_{1}^{3}} \right) \left(\frac{\partial \mathbf{a}_{1}^{3}}{\partial \mathbf{z}^{3}} \right) \left(\frac{\partial \mathbf{z}^{3}}{\partial \mathbf{a}_{1}^{2}} \right) \right) \left(\frac{\partial \mathbf{a}_{1}^{2}}{\partial \mathbf{z}^{2}} \right) \left(\frac{\partial \mathbf{z}^{2}}{\partial \theta_{k1}^{1}} \right)$$

$$-\eta \frac{\partial E}{\partial \theta_{k_1}^1} = -\eta \Big(-(y - a_1^3)g'(z^3)\theta^2 \Big)g'(z^2)a_k$$

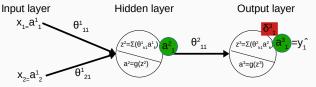

Formulating this again as the chain rule

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial a_{1}^{3}} \right) \left(\frac{\partial a_{1}^{3}}{\partial z^{3}} \right) \left(\frac{\partial z^{3}}{\partial a_{1}^{2}} \right) \right) \left(\frac{\partial a_{1}^{2}}{\partial z^{2}} \right) \left(\frac{\partial z^{2}}{\partial \theta_{k1}^{1}} \right)$$

$$-\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \Big(-(y - a_{1}^{3})g'(z^{3})\theta^{2} \Big) g'(z^{2}) a_{k}$$
$$= \eta \Big((y - a_{1}^{3})g'(z^{3})\theta^{2} \Big) g'(z^{2}) a_{k}$$

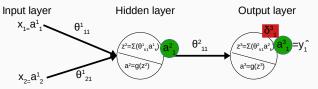

Formulating this again as the chain rule

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial \mathbf{a}_{1}^{3}} \right) \left(\frac{\partial \mathbf{a}_{1}^{3}}{\partial z^{3}} \right) \left(\frac{\partial z^{3}}{\partial \mathbf{a}_{1}^{2}} \right) \right) \left(\frac{\partial \mathbf{a}_{1}^{2}}{\partial z^{2}} \right) \left(\frac{\partial z^{2}}{\partial \theta_{k1}^{1}} \right)$$

$$-\eta \frac{\partial E}{\partial \theta_{k1}^1} = -\eta \Big(-(y - a_1^3) g'(z^3) \theta^2 \Big) g'(z^2) a_k$$
$$= \eta \Big(\underbrace{(y - a_1^3) g'(z^3)}_{= \delta_1^3} \theta^2 \Big) g'(z^2) a_k$$

Formulating this again as the chain rule

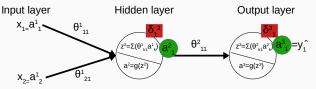

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial \mathbf{a}_{1}^{3}} \right) \left(\frac{\partial \mathbf{a}_{1}^{3}}{\partial z^{3}} \right) \left(\frac{\partial z^{3}}{\partial \mathbf{a}_{1}^{2}} \right) \right) \left(\frac{\partial \mathbf{a}_{1}^{2}}{\partial z^{2}} \right) \left(\frac{\partial z^{2}}{\partial \theta_{k1}^{1}} \right)$$

$$-\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(-(y - a_1^3) g'(z^3) \theta^2 \right) g'(z^2) a_k$$

$$= \eta \left(\underbrace{(y - a_1^3) g'(z^3)}_{= \delta_1^3} \theta^2 \right) g'(z^2) a_k = \eta \left(\delta_1^3 \theta^2 \right) g'(z^2) a_k$$

$$= \delta_1^3$$

Formulating this again as the chain rule

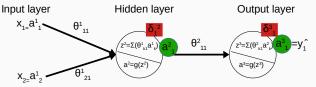

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial a_{1}^{3}} \right) \left(\frac{\partial a_{1}^{3}}{\partial z^{3}} \right) \left(\frac{\partial z^{3}}{\partial a_{1}^{2}} \right) \right) \left(\frac{\partial a_{1}^{2}}{\partial z^{2}} \right) \left(\frac{\partial z^{2}}{\partial \theta_{k1}^{1}} \right)$$

$$-\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(-(y - a_{1}^{3})g'(z^{3})\theta^{2} \right) g'(z^{2}) a_{k}$$

$$= \eta \left(\underbrace{(y - a_{1}^{3})g'(z^{3})}_{= \delta_{1}^{3}} \theta^{2} \right) g'(z^{2}) a_{k} = \eta \left(\underbrace{\delta_{1}^{3}\theta^{2}}_{= \delta_{1}^{2}} g'(z^{2}) a_{k} \right)$$

$$= \delta_{1}^{3}$$

Formulating this again as the chain rule

$$\Delta\theta_{k1}^{1} = -\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(\left(\frac{\partial E}{\partial \mathbf{a}_{1}^{3}} \right) \left(\frac{\partial \mathbf{a}_{1}^{3}}{\partial z^{3}} \right) \left(\frac{\partial z^{3}}{\partial \mathbf{a}_{1}^{2}} \right) \right) \left(\frac{\partial \mathbf{a}_{1}^{2}}{\partial z^{2}} \right) \left(\frac{\partial z^{2}}{\partial \theta_{k1}^{1}} \right)$$

$$-\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = -\eta \left(-(y - a_{1}^{3})g'(z^{3})\theta^{2} \right) g'(z^{2}) a_{k}$$

$$= \eta \left(\underbrace{(y - a_{1}^{3})g'(z^{3})}_{= \delta_{1}^{3}} \theta^{2} \right) g'(z^{2}) a_{k} = \eta \left(\underbrace{\delta_{1}^{3}\theta^{2}}_{= \delta_{1}^{2}} \right) g'(z^{2}) a_{k} = \eta \delta_{1}^{2} a_{k}$$

$$= \delta_{1}^{3}$$

Formulating this again as the chain rule

$$-\eta \frac{\partial E}{\partial \theta_{k1}^1} = -\eta \left(\left(\frac{\partial E}{\partial \mathbf{a}_1^3} \right) \left(\frac{\partial \mathbf{a}_1^3}{\partial z^3} \right) \left(\frac{\partial z^3}{\partial \mathbf{a}_1^2} \right) \right) \left(\frac{\partial \mathbf{a}_1^2}{\partial z^2} \right) \left(\frac{\partial z^2}{\partial \theta_{k1}^1} \right)$$

If we had more than one weight θ^2

$$-\eta \frac{\partial E}{\partial \theta_{k1}^{1}} = \eta \Big(\sum_{j} \underbrace{(y_{j} - a_{1}^{3}) g'(z_{j}^{3})}_{= \delta_{j}^{3}} \theta_{1j}^{2} \Big) g'(z^{2}) a_{k}$$

$$= \eta \Big(\sum_{j} \delta_{j}^{3} \theta_{1j}^{2} \Big) g'(z^{2}) a_{k} = \eta \delta_{1}^{2} a_{k}$$

$$= \delta_{1}^{2}$$
